

CC	λ	observed $\hat{\lambda}$	c	preset AHT (min)	AHT used (min)	enroll %	μ_+	μ_-	θ_A	θ_S	θ_L	$\bar{\theta}$	abandon time (min)
1	145.4	228.0	32.5	20.8	20	50	13.50	13.50	21.6	16.2	16.2	54	10.0
2	623.3	2931.5	52.0	21.9	20	50	13.50	13.50	4.0	3.0	3.0	10	54.0
3	700.1	2396.5	72.0	44.2	40	50	6.75	6.75	4.0	3.0	3.0	10	54.0
4	164.8	712.0	51.0	44.8	40	50	6.75	6.75	21.6	16.2	16.2	54	10.0

Table 1: Call center preset parameters used by the dashboard. All rates are per 540-minute model day. The dashboard computes $\mu_+ + \mu_- = 540/\text{AHT}$ using the nearest available AHT menu value, then sets $\mu_+ = (\text{enroll\%/100})(\mu_+ + \mu_-)$ and $\mu_- = \mu_+ + \mu_- - \mu_+$. The theta columns use the default balanced theta scenario for each preset.

Parameter	Value	Interpretation
δ_B	$1/130 = 0.007692$	Recertification rate
δ_S	3.0	Short-orbit callback rate, one callback every 3 hours
δ_L	$1/9 = 0.111111$	Long-orbit callback rate, one callback every 9 days
γ	$1/260 = 0.003846$	Benefit loss rate

Table 2: Fixed parameters shared across call center presets.
